

Starting Up Gravar Jr.

v1.38 — Visible Frame Clip

1. Open Gravar Jr.

Open **index.html** from the package or deploy the package to a web host for iPad/YouTube use.

2. Choose a video

Open the folder menu and choose **Local file**, **YouTube**, or **Panopto**. Local file is best when you need visible frame capture and full timing control.

3. Navigate the picture

Use +/- or pinch to enlarge the picture inside its original picture boundary. The black video pane and original picture boundary should not expand. Drag the enlarged picture to reposition it. Use Command-Option drag left/right to scrub and Command-Option drag up/down to zoom.

4. Add transcript lines

Use **Add**, **Start**, and **End**. Use Auto Line from the folder menu to create timed blank lines at a specified interval.

5. Add notes and clips

Use  for a line note. Use  Field Note for field observations and **Fr Clip** to insert a frame and timing information into the Field Note.

6. Save and export

Save the project JSON to preserve the working project. Export CSV for tabular review or HTML for a readable report with notes and frame clips.
